Sales Performance Analysis

Power BI Dashboard Report

Prepared for Management Review — Product, Category and Regional Sales Trends

1. Objective

Management requires a quick, visual understanding of sales performance across products, categories, and regions in order to identify key business patterns and support data-driven decisions. This report documents the Power BI dashboard built to meet that requirement and summarizes the business insights it reveals.

2. Data Source

The dashboard is built on an order-level retail sales dataset containing the following key fields:

- Order Date (Year, Quarter, Month, Day hierarchy)
- Region (Central, East, South, West)
- Category (Technology, Furniture, Office Supplies)
- Sub-Category (Phones, Machines, Chairs, Tables, Binders, Storage, Accessories, Appliances, Furnishings, Paper, Bookcases, and others)
- Sales and Profit measures

3. Dashboard Overview

The dashboard below combines slicers, bar charts, a treemap, a time-series trend, and KPI cards on a single canvas so that management can filter and drill down interactively.

Figure 1: Power BI Sales Performance Dashboard

4. Visualizations Implemented

Visual	Chart Type	Purpose
Sales by Region	Bar Chart	Compares total sales across Central, East, South, and West regions.
Sales by Sub-Category	Column Chart	Highlights the single highest-performing sub-category by sales volume.
Sales by Sub-Category (detail)	Horizontal Bar Chart	Ranks all sub-categories (Phones, Machines, Chairs, Tables, etc.) to show product-level performance.
Sales by Category	Treemap	Shows the proportional contribution of Technology, Furniture, and Office Supplies to total sales.
Sales by Year, Quarter, Month and Day	Line Chart	Tracks sales trend over time (2014–2017) to reveal seasonality and spikes.
Sum of Profit (Jan / Feb / Mar)	KPI Cards	Surfaces monthly profit totals for quick monitoring.
Region / Sub-Category / Order Date	Slicers	Let management filter the entire dashboard interactively by region, product, or date.

5. Key Business Insights

5.1 Regional Performance

With the South region selected via the slicer, sales for that region total close to 0.3M, allowing a direct comparison against other regions when toggled. Using the Region slicer, management can instantly isolate underperforming or overperforming regions without rebuilding the report.

5.2 Category and Sub-Category Trends

The treemap shows Technology and Furniture as the two largest contributors to sales, with Office Supplies contributing a comparatively smaller share. At the sub-category level, Phones and Machines lead sales volume, followed by Chairs and Tables, while Bookcases, Labels, and Fasteners sit at the lower end — indicating where inventory and marketing focus is currently concentrated.

Figure 3: Sum of Sales by Sub-Category

5.3 Time-Based Trend

The Sum of Sales by Year, Quarter, Month and Day line chart spans 2014 to 2017 and shows a generally low, steady baseline punctuated by sharp periodic spikes (notably an early peak exceeding 20K), suggesting occasional bulk or seasonal orders rather than a smooth demand curve. This pattern points to recurring seasonal or promotional peaks worth investigating further.

Figure 4: Sum of Sales by Year, Quarter, Month and Day

5.4 Profitability

The KPI cards show Sum of Profit rising month over month in the period shown: January (2.32K), February (5.16K), and March (6.99K) — an upward trend that, combined with the category and regional breakdowns, helps management see not just where sales occur but where they are most profitable.

6. Recommendations

- Investigate the drivers behind the periodic sales spikes seen in the time-series chart to plan inventory and staffing ahead of similar future peaks.
- Prioritize marketing and stock allocation toward Technology and top sub-categories (Phones, Machines) that are already driving the majority of sales.
- Review the South region's performance against other regions using the slicer to identify whether it should be a growth focus or benchmark for other regions.
- Extend the Sum of Profit KPI cards across all months to monitor whether the Jan–Mar upward profit trend continues through the year.

7. Conclusion

The dashboard successfully consolidates product, category, and regional sales data into a single interactive view, enabling management to quickly identify top-performing products, compare regions, and monitor sales and profit

trends over time. The combination of slicers, ranked bar charts, a treemap, and a time-series trend line provides both a high-level summary and the ability to drill into specific dimensions as needed.
